## IDC Web-Enabled Carbon Management

The IDC range of web-enabled data loggers offers the most comprehensive range of meter interfaces available:

- Connects to most CoP5 meters including Elster & PRI via 1107 port or serial adapter
- Pulsed inputs (up to 32) to monitor conventional pulsing utility meters
- RS485 Modbus allowing connection to panel mounted sub-meters
- Optional radio receiver for remote reading via Radio-Tech transmitters

Data is collected via the Ethernet network using Data Collection Server (DCS) software. Alternatively, we offer a secure web based service for data collection, storage and reporting. As the system is always on, real-time electrical demand can be monitored and managed (from meters with RS232 or RS485 communications)
